

My Ready to Go Backpack

This application will be a good tool for this education and empower children with autism spectrum disorders and their families.

The past disaster preparedness education provided one-sided general knowledge of what would happen and what we need in shelters.

However, it would be necessary to start these education from realizing who each person is and sharing it with others.

This backpack is designed especially for children with ASD and their families. It will help them prepare the disaster actively and individually, and provide them necessary knowledge in times of disasters.

"My Ready to Go Backpack" has a name tag, one big pocket, and five small pockets.

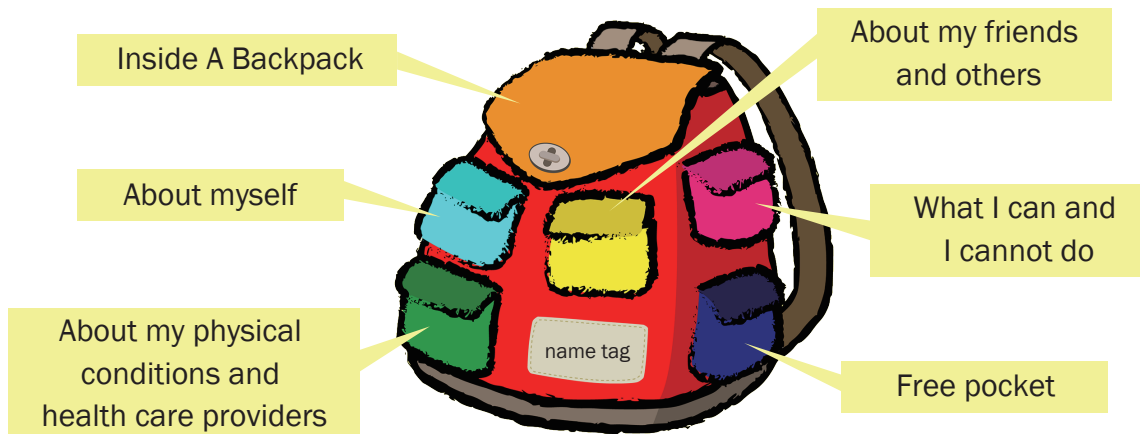

You can change all of them to your favourite colors and can put your name on the name tag.

When you touch the pockets, five cards will appear. If you touch the card, you can write down your data. You also can write or rewrite, and save your own data on each card. You can see your own history, too.

You can also take pictures and put them on the icons of each card.

So it will become easy for you to understand what kind of card it is.

one big pocket, and five small pockets

You can change all of them to your favourite colors and can put your name on the name tag.
